Title of the Project: Multi-Agent Financial Research System

Abstract

The increasing volume and complexity of financial documents, including annual reports, financial statements, and regulatory filings, make it challenging for finance students, MBA learners, and junior financial analysts to extract meaningful insights efficiently. Manual analysis of these documents to identify financial metrics, evaluate business risks, compare company performance, and prepare research reports is time-consuming, labor-intensive, and requires considerable financial expertise. The primary users of this system are finance students, business school learners, investment research trainees, and early-career financial analysts who require a faster and more reliable method for analyzing financial reports. Existing approaches largely depend on manual document review or general-purpose AI tools that generate summaries without reliable source verification. Although some financial analysis platforms support individual tasks such as summarization or ratio calculation, they lack collaborative multi-agent workflows, comprehensive financial analysis, and source-grounded responses. These limitations reduce transparency and may lead to unsupported conclusions. To address these challenges, this project proposes a Multi-Agent Financial Research System that employs specialized AI agents to perform financial document analysis collaboratively. The Document Agent processes uploaded reports through parsing, chunking, embedding generation, and indexing. The Extraction Agent identifies key financial metrics, while the Red Flag Agent detects financial risks and anomalies. A Comparison Agent benchmarks company performance, the Research Agent answers financial queries using source-backed retrieval, and the Report Agent generates a structured analyst-style report. The system emphasizes accuracy, transparency, and evidence-based reasoning throughout the workflow. The project focuses on analyzing uploaded financial documents and generating trustworthy insights through coordinated AI agents. It does not provide stock price prediction, investment recommendations, or information beyond the uploaded documents. The expected outcome is a reliable financial research platform that significantly reduces manual analysis time while maintaining high citation accuracy and trustworthy responses. Success will be measured through accurate financial metric extraction, effective risk detection, reliable source citations, efficient multi-agent collaboration, and comprehensive report generation.
